SPRAYABLE HIGH TEMPERATURE HIGH PERFORMANCE FOODGRADE GREASE

The spray grease in question is a food-grade, fully synthetic product that utilizes calcium sulphonate as its base. Its impressive features include remarkable mechanical stability, a high dropping point, exceptional load-bearing capabilities, reduced wear and tear, and excellent resistance to water, steam, and corrosion. In terms of performance, this technology not only rivals but even surpasses other spray greases in numerous ways. Its advanced design enables it to deliver top-notch performance under extreme temperatures, ranging from -40 to over 200 °C, and during prolonged periods of infrequent lubrication, making it ideal for various food processing applications. This grease is most suitable for low to medium stress situations that involve harsh environmental conditions, such as exposure to (salt) water, steam, temperature fluctuations, and other foreign materials like process fluids typically found in sugar beet processing. In the food industry, the product can be applied to slide ways, chains, high-load bearings, and for general lubrication
