## FOODGRADE CHAIN AND SLIDE LUBRICANT CONTAINING PTFE

This product is a white, food-grade lubricant that comes in a spray package and is highly adhesive. Its composition consists of a food-grade synthetic fluid fortified with PTFE. It's important to note that this product is not suitable for use in low-temperature environments.

This product is a high-performance food-grade lubricant that is ideal for lubricating chains, conveyors, slides, joints, mould slides, small bearings, or any other application that requires a high-quality food-grade lubricant. Additionally, it's suitable for use in various industries, including textile, paper and graphic arts, plastic, tobacco, and the elevator industry. Furthermore, it's highly effective in lubricating motorcycle chains and high-speed kart transmission chains. However, it's not recommended for use below 0°C, as the product may become too viscous to provide adequate lubrication in sub-zero temperatures, despite its technical lower temperature limit of -35°C.
